

Lecture Summary AUD-20260816-WA0070.mp3

Here are the main topics and key takeaways from the lecture transcript:

****Main Topics:****

1. Introduction to Post Requests
2. Comparison of Get and Post Requests
3. Creating a Path Operation for a Post Request
4. Sending Data in the Body of a Post Request
5. Extracting Data from the Body of a Post Request

****Key Takeaways:****

- * A post request sends data to the API server, whereas a get request retrieves data.
- * To convert a traditional get request to a post request, use the `app.post()` decorator with a specific URL.
- * To send data in the body of a post request, use the "Body" section in Postman and select JSON or other formats as needed.
- * To extract data from the body of a post request, import the `body` parameter from `FastAPI.params` and assign it to a variable (e.g., `payload`).
- * The extracted data can be used to create a new post, store it in a database, and send it back to the user.

****Notes on Best Practices:****

- * In a real application, you would typically store the data in a database instead of sending it directly back to the user.
- * The example code uses a simplified approach for demonstration purposes only.
